

1    ABSTRACT OF THE DISCLOSURE

2           A modular system for projection television is disclosed wherein the major  
3    components may be removed from the frame or cabinet, which may then be folded into a  
4    compact unit for transporting. The projector is of a type that may be used either as a front  
5    or rear projecting television. Where appropriate, amplifiers, speakers, projector and  
6    optical devices are electrically connected within the enclosure, which may be achieved  
7    through the use of slot connectors or other means that permit easy withdrawal and  
8    reinsertion of the modules. The screen may be detached and used in the front projection  
9    mode, or designed to fold along with the frame or cabinet.
